Introduction

In this tutorial, you will learn how to use Data Virtualization (DV) add-on component within the IBM® Cloud Private for Data (ICP for Data) to integrates data sources across multiple types and locations and turns it into one logical data view. Creating connections to your data sources enables you to quickly view across your organization's data. This virtual data platform enables real-time analytics without moving data, ETLs, and additional storage requirements, so processing times are greatly accelerated. This produces real-time intuitive results quickly and dependably.

Tutorial will use two different data sources from Db2 and Informix. On Db2, you have MORTGAGE_CUSTOMER table that stores individual customer information, those who applied for mortgage loan. Other hand at Informix side, you have MORTGAGE_DEFAULT table that tracks default status of individual mortgage. Using these two tables you need to find out which RESIDENCE type mostly default on mortgage.

Table MORTGAGE_CUSTOMER on Db2		Table MORTGAGE_DEFAULT on Informix	
Column Name	Data Type	Column Name	Data Type
APPLIED_ONLINE	CHAR	id	INTEGER
CARD_DEBT	INTEGER	mortgage_default	CHAR
CURRENT_LOANS	INTEGER		
ID	INTEGER		
INCOME	INTEGER		
LOAN_AMOUNT	INTEGER		
NO_OF_CARDS	SMALLINT		
RESIDENCE	CHAR		
YRS_CURRENT_ADD	SMALLINT		
YRS_CURRENT_EMP	SMALLINT		

Using DV you will create a virtual table from above two data sources. Next use a R script to access the virtual table and find out the solution. There is absolutely no need of moving data, ETLs, and additional storage.

Before you continue with this tutorial make sure DV and RStudio are provisioned on your environment. Both are add-on components in ICP for Data.

This tutorial has been developed based on ICP for Data v.1.2.1.

1. Access Credentials

To work through the demo, you need access to Db2 and Informix databases. You will use following access credential while define data sources.

1.1. Access credential for Db2 database

JDBC connection credential for Db2:

JDBC Host name	<Same IP address as your web console>
Port number	50000
Database name	MORTGAGE
User ID	db2inst1
Password	password
Db2	Version 11.1
JDBC connection string	jdbc:db2://<same IP as Web Console>:50000/MORTGAGE

1.2. Access credential for Informix database

JDBC connection credential for Informix:

JDBC Host name	<Same IP address as your web console>
Port number	9088
Database name	MORTGAGEDB
User ID	informix
Password	in4mix
Informix	Version 12.10.FC12W1DE
JDBC connection string	jdbc:informix-sqli://<same IP as Web console>:9088/mortgagedb: INFORMIXSERVER=informix;user=informix;password=in4mix

1.3. Setting up the databases and sample tables

This tutorial host Db2 and Informix server instances in Docker containers and load sample data to respective databases. You need to run this setup step from command prompt as user root.

a) Log in to the cluster where ICP for Data is deployed.

b) From your home directory, clone the tutorial sample files:

```
git clone https://github.com/sanjitc/ icp4d-tutorials.git  
or  
git clone https://github.com/IBM-ICP4D/icp4d-tutorials.git
```

c) Change to the tutorials directory:

```
cd icp4d-tutorials/tutorials
```

d) Run the following command to load the sample data into a Db2 database:

```
./load_samples.sh -t mortgage-001
```

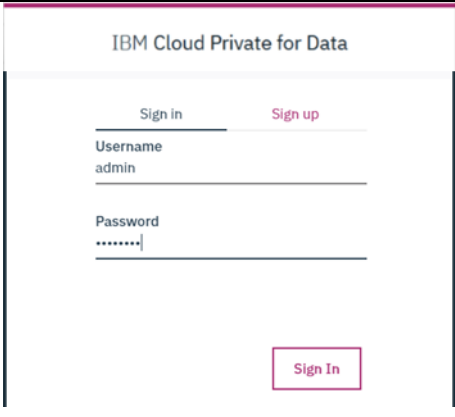

e) Run the following command to load the sample data into an Informix database:

```
./load_samples.sh -t data-virtualization-001
```

f) After data loading completes, Db2 and Informix are hosted on your cluster as a Docker container.

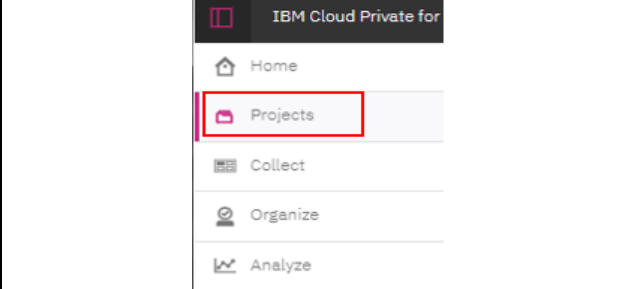

1.4. Sign in to ICP for Data web console as Administrator

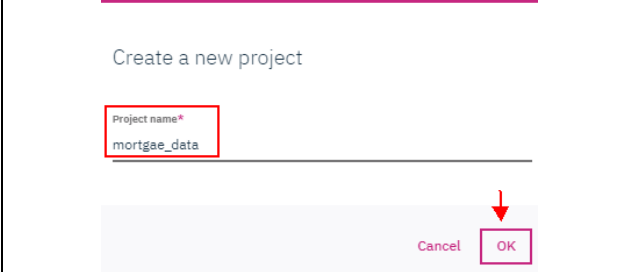

You should use latest version of Firefox or Google Chrome browser to access the ICP for Data web console. Starting from here all instruction needs to execute on ICP for Data web console only. You need to login as admin who has administrator privileges.

	<p>Sign in to the ICPD web console as user 'admin' and password is 'password'.</p>
--	--

2. Create analytic project

Create an analytic project that you going to use for virtualizing data.

	<p>Select 'Projects' from right pane to create a new analytical project</p> <p>Click on the  New project icon</p>
---	--

	<p>Provide a project name as mortgage_data and click OK</p> <p>On the next 'Create project' window, click on Create</p>
---	--

3. Data Virtualization

Data virtualization (DV) integrates data sources across multiple types and locations and turns it into one logical data view. Creating connections to your data sources enables you to quickly view across your organization's data.

3.1. Giving users access to data virtualization (optional)

In order for a user to have access to the data virtualization service, you must assign them to appropriate data virtualization roles.

This is for information only. In this demo you will use user 'admin', which has all necessary virtualization roles.

ADD USERS

Grant access to users

Find

<input type="checkbox"/>	Name	Username	Role
<input checked="" type="checkbox"/>	admin	admin	Admin
<input checked="" type="checkbox"/>	deng1	deng1	Engineer
<input checked="" type="checkbox"/>	dst1	dst1	User
<input checked="" type="checkbox"/>	dstw1	dstw1	User

1. Select **Collect > Virtualize data** from left pane
2. Select **Menu > Manage users > Add users** from top
3. Check all users that you created earlier and keep their default role.
4. Click **Add**

3.2. Adding a new data source for Db2

DV supports many relational and non-relational data sources, as well as files that reside on a local disk or network file system, that you can add to your data source ecosystem. After a data source has been added, any user that has virtualize permission has the ability to create virtual tables. DV agents connect to relational data sources using JDBC protocol. In this tutorial you will add two data sources, one for Db2 and other one for Informix.

Define a data connection to Db2. Use following connection information with 'Add connection'. If you already have an existing database connection, select that for Db2 data source.

Add data source ⓘ

Connect to the data source Step 2 of 2

Data source type
Db2 Family

Host name
[Redacted]

Port
50000

Database Name
MORTGAGE

Username
db2inst1

Password

Options
Enter JDBC connection options

☐ Use SSL
☐ Verify server SSL certificate ⓘ
SSL certificate (optional)

Cancel Back Add

1. Go to **Collect > Virtualized data > Menu > Data sources**
2. Click **Add data source > New data source**
3. Update data source with following information:
Data source type = Db2
Host name = <IP of node 1>
Port = 50000
Database Name = MORTGAGE
Username = db2inst1
Password = password
4. Click **Add**

3.3. Adding a new data source for Informix

Let's add a new data source for the Informix. First define a data connection to Informix. Use following connection information with 'Add connection'. If you already have an existing database connection, select that for Informix data source.

Edit connection ⓘ

Data source type
Informix

Host name
[Redacted]

Port
9088

Database Name
mortgagedb

Username
informix

Password

Informix server
informix

Options
Enter JDBC connection options

☐ Use SSL

1. Go to **Collect > Virtualized data > Menu > Data sources**
2. Click **Add data source > New data source**
3. Update data source with following information:
Data source type = Informix
Host name = <IP of node 1>
Port = 9088
Database Name = mortgagedb
Username = informix
Password = in4mix
Informix server = informix
4. Click **Add**

3.4. Select tables for virtualization

The most common mechanism for virtualizing data is to create a "view" or virtual table. Virtual table can be full or segment of data from one or more tables. You can then run queries against the resulting virtual table.

Data virtualization | Virtualize

Find tables by name, schema, or column.

7 tables

Add to cart

Table	Schemas	Databases
<input checked="" type="checkbox"/> MORTGAGE_CUSTOMER	DB2INST1	mortgage
<input type="checkbox"/> MORTGAGE_DEFAULT	DB2INST1	mortgage
<input type="checkbox"/> MORTGAGE_JOIN	DB2INST1	mortgage
<input type="checkbox"/> MORTGAGE_PROPERTY	DB2INST1	mortgage
<input checked="" type="checkbox"/> mortgage_default	"informix"	mortgagedb
<input type="checkbox"/> sysdomains	"informix"	mortgagedb
<input type="checkbox"/> sysindexes	"informix"	mortgagedb

- Click **Collect > Virtualized data > Menu > Virtualize**
- Select three tables **MORTGAGE_CUSTOMER** from MORTGAGE database and **mortgage_default** from mortgagedb, then click **Add to cart**
- Click **View cart**
- Click **Next**

- Select **project** to assign virtualized table to your analytics project. Then, choose the **mortgage_data** project.
- Choose **publish to catalog** for include virtualized table to the data catalog. This operation will create a publishing request, a data steward must approve the request before the asset is added to the enterprise data catalog.
- Click **Virtualize** to complete the process

Assign and manage your virtual tables below.

mortgage_default	USER999

3.5. Creating virtual table

You can create a new virtual table based on existing tables. Join source tables and create the virtual table.

1. Click **Collect > Virtualized data > Menu > My data** to see your virtualized tables.
2. Check **MORTGAGE_CUSTOMER** and **mortgage_default** tables for join.
3. Click on **Join view**
4. Uncheck the ID column from mortgage_default table for reduction redundancy
5. Click and drag from one **ID** column to another to create a join key. Both join keys must be of the same data type.
6. Click **Join**

Join virtual objects

Click and drag from one table to the other to create a join key.

Table 1: MORTGAGE_CUSTOMER

Find

<input checked="" type="checkbox"/>	Column Name	Data Type
<input checked="" type="checkbox"/>	CURRENT_LOANS	INTEGER
<input checked="" type="checkbox"/>	ID	INTEGER
<input checked="" type="checkbox"/>	INCOME	INTEGER
<input checked="" type="checkbox"/>	LOAN_AMOUNT	INTEGER
<input checked="" type="checkbox"/>	APPLIED_ONLINE	CHAR
<input checked="" type="checkbox"/>	CARD_DEBT	INTEGER
<input checked="" type="checkbox"/>	NO_OF_CARDS	SMALLINT
<input checked="" type="checkbox"/>	RESIDENCE	CHAR
<input checked="" type="checkbox"/>	YRS_CURRENT_ADD	SMALLINT

Table 2: mortgage_default

Find

<input type="checkbox"/>	Column Name	Data Type
<input type="checkbox"/>	id	INTEGER
<input checked="" type="checkbox"/>	mortgage_default	CHAR

Join two virtual tables [Open in SQL editor](#)

Publish to catalog

☒ Yes ☐ No

3.6. Publish virtualized table

A data steward needs approve the published request before the asset is added to the enterprise data catalog. You signed in as user 'admin', it should allow to publish the virtual table.

The screenshot shows a web interface titled "Pending Publish to Catalog Requests". It features a search bar and a table with columns: Name, Type, Project, Owner, Date Updated, and Status. A single entry is listed with Name "USER999.CUSTOMER_DEFAULT", Type "view", Project "-", Owner "admin", Date Updated "19 March 2019, 11:06AM", and Status "Pending". To the right of the entry are two buttons: "Approve" and "Reject".

1. Click on  access the **Home** page
2. Click on **Pending Publish to Catalog Requests**
3. Click on  icon on left for virtual table **CUSTOMER_DEFAULT** that you created
4. Click on **Approve**

3.7. Access information for virtual table

To access virtual table from external application, you need the JDBC connection information. Click on **Collect > Virtualized data > Menu > Service details** to find out access information.

4. Virtual Table From IDE

You can access virtual table from inside or outside of ICP for Data. In this example a R script used for accessing the virtual table. ICP for Data comes with an add-on RStudio component that provides an Integrated Development Environment (IDE) for working with R.

4.1. Start IDE

Make sure IDE has started before you can use it.

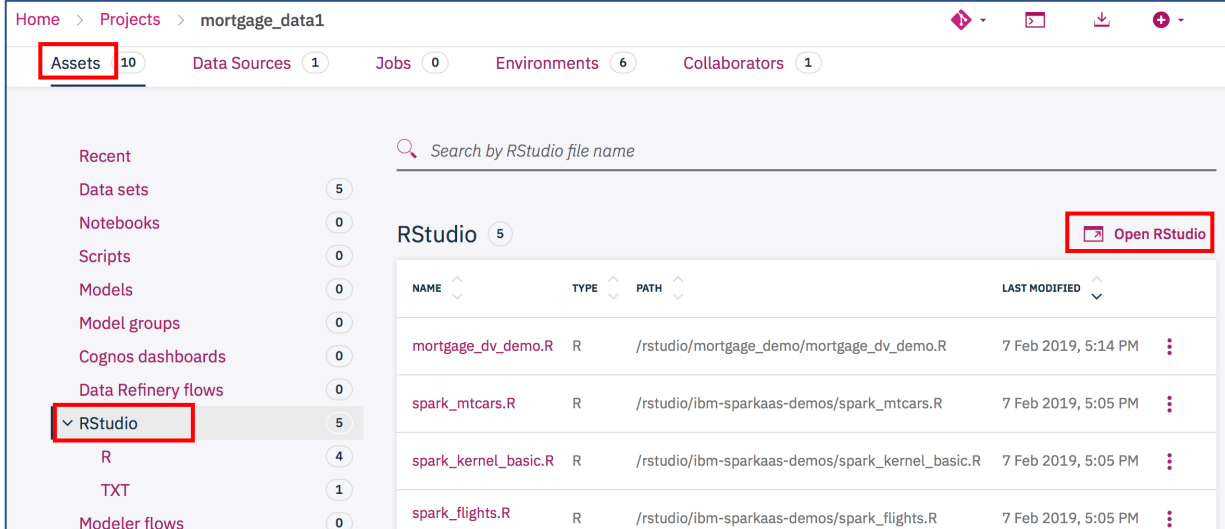

Select your project **mortgage_data** from project menu

Choose **Environments** tab. If RStudio not running, click on  icon to start.

4.2. Launch RStudio

From inside the analytic project, choose **Assets > RStudio** and click on **Open RStudio**.

The screenshot shows the ICP for Data interface. The 'Assets' tab is selected, showing a list of assets. The 'RStudio' asset is highlighted in the left sidebar. The 'Open RStudio' button is visible in the top right corner of the RStudio section.

4.3. Load R script

Within the RStudio, go to File > New File > R script to run script. Copy the following script and paste it in the source section. This simple R script will simply run a SELECT statement against the virtual table and retrieve data and create a treemap to visually displays mortgage default by residency type.

Before you run the script, please change the **url**, **databaseUsername** and **databasePassword** according to your system, which you found in step 3.7 (Access information for virtual table).

```
#####
### This is a sample R code that access the virtual table from Data Virtualization environment and create a treemap
### to visually displays mortgage default by residency type.
###
### Before executing the R script update URL, databaseUsername and databasePassword variables according to your environment .
### Variable values can be found in 'Collect -> Virtualized data -> Menu -> Service details' section in Data Virtualization environment.
#####

library(RJDBC)                # Load the "RJDBC" package
library(treemap)              # Call the TREEMAP package
library(dplyr)                # Load DPLYR package

driverClassName <- "com.ibm.db2.jcc.DB2Driver" # Load JDBC driver using Class.forName method
driverPath <- "/dbdrivers/db2jcc4.jar"         # Db2 JDBC driver path in RStudio docker image

url <- "<JDBC Connection URL>"                # Update JDBC connection URL according to your
                                              # environment information in 'Collect -> Virtualized
                                              # data -> Menu -> About'

databaseUsername <- "<username>"              # Database user
databasePassword <- "<password>"              # Database user password

drv <- JDBC(driverClassName, driverPath)        # Initialize Java VM and load Java JDBC driver
conn <- dbConnect(drv, url, databaseUsername, databasePassword) # Create JDBC connection using dbConnect()

selStr <- "SELECT * FROM USER999.MORTGAGE_CUSTOMER_DEFAULT
          WHERE \"mortgage_default\" = 'YES';"   # Query string for retrieve dataset

md <- dbSendQuery(conn, selStr)                 # Let's run a query
mortgageData <- fetch(md, -1)                  # Store query result in a data frame

mortgageData1 <- mortgageData %>%              # Expand residency type to meaningful name
  mutate(RESIDENCE = case_when(RESIDENCE == "O" ~ "Owner Occupier",
                               RESIDENCE == "P" ~ "Private Renting",
                               RESIDENCE == "L" ~ "Living With Parents",
                               RESIDENCE == "S" ~ "Sheltered"))

head(mortgageData1)                           # Return first parts of data frame

treemap(mortgageData1,                        # Create a treemap to visually displays,
        index = c("RESIDENCE"),              # mortgage default by residency type.
        vSize = "YRS_CURRENT_EMP",
        title = "Mortgage Default by Residency Type"
        )

dbDisconnect(conn)                            # Disconnect and close the connection
```

If any R package not already installed, you need to install them first before executing the above script. Use **install.packages("<package name>")** command to install a R package.

4.4. Run the script

Highlight the R script in the RSudio and click on **Run** to retrieve data.

The screenshot shows the RStudio interface with a project named 'mortgage_data'. The R script in the editor is as follows:

```
1 library(RJDBC)
2 library(treemap)
3 library(dplyr)
4
5 driverClassName <- "com.ibm.db2.jcc.DB2Driver"
6 driverPath <- "/dbdrivers/db2jcc4.jar"
7
8 url <- "jdbc:db2://dv-server.zen.svc.cluster.local:32051/bigsql"
9 databaseUsername <- "user999"
10 databasePassword <- "myS-uFC-SfTE419e"
11
12 drv <- JDBC(driverClassName, driverPath)
13 conn <- dbConnect(drv, url, databaseUsername, databasePassword)
14
15 selStr <- "SELECT * FROM ICP4D.MORTGAGE_CUSTOMER_DEFAULT
16 WHERE 'mortgage.default' = 'YES';"
17
18 md <- dbSendQuery(conn, selStr)
19
20 # Let's run a query
21 # Show names result in a data frame
22 result <- dbFetch(md)
23
24 # Create a treemap to visually displays,
25 # mortgage default by recedency type.
26 treemap(mortgageData1,
27         index = c("RESIDENCE"),
28         vSize = "YRS_CURRENT_EMP",
29         title = "Mortgage Default by Residency Type")
30
31 # Disconnect and close the connection
32 dbDisconnect(conn)
```

The console output shows the results of the query:

```
2      20      1 Owner Occupier
3      14      1 Owner Occupier
4      27      2 Private Renting
5       9      1 Private Renting
6      15      2 Sheltered
```

The treemap visualization, titled "Mortgage Default by Residency Type", shows the distribution of mortgage defaults by residency type. The largest category is "Owner Occupier" (blue), followed by "Private Renting" (green). "Living With Parents" (yellow) and "Sheltered" (pink) are smaller categories.

Residency Type	Count
Owner Occupier	20
Private Renting	27
Living With Parents	9
Sheltered	15

The above treemap figure shows RESIDENCE type “Owner Occupier” has highest rate of default on mortgage.
